

Bug: Agent incorrectly greets caller by wrong name

Details: The patient opened the call saying "Hi, this is Robert" but the agent responded "Am I speaking with Maria?" — a name pulled from the phone number lookup. When a caller explicitly states their name upfront, the agent should acknowledge the discrepancy rather than ignoring it and asking if they're someone else entirely.

Bug: Agent assumes patient identity from caller ID/phone number lookup without voice-based verification, ignoring audio cues that contradict the assumption.

Details: The agent opened the call by asking "Am I speaking with Maria?" based solely on the phone number associated with the account, despite the caller's voice being clearly male and inconsistent with that name. Rather than asking an open-ended identity question (e.g., "Can I get your name, please?"), the agent anchored on the phone-number lookup and never flagged the mismatch between the expected patient and the voice it was hearing.

Where to find: scenario_02_20260705_114909

Bug: Agent frequently interrupts the caller mid-sentence across most calls, rather than waiting for natural pauses or turn completion.

Bug: Infinite Repeat Loop When Patient Repeatedly Requests Repetition

Description:

When a patient repeatedly asks the agent to "repeat that again" or makes similar repetition requests multiple times in succession, the conversation enters an infinite loop. Instead of handling the repeated requests gracefully (e.g., rephrasing, limiting retries, or escalating), the agent continues repeating the same response indefinitely, preventing the conversation from progressing.

Where to find: loop.mp3

Bug: Agent fails to detect inconsistent patient name across verification

Details: The patient gave four different name variations throughout the call , "John Smith", "Jonathan Steel", "John R. Smith", and "John Steel" , and the agent never flagged the inconsistency.

Where to find: scenario_18_20260704_010114

Bug: Agent fails to adapt communication style to patient type

Details: When an elderly confused patient went off-topic and struggled to remember her medication name, the agent continued asking for the same structured information ("Can you provide your date of birth?") in the same tone and pace as with a straightforward patient. It never slowed down, simplified its language, offered prompts to help the patient remember, or showed any awareness that the caller was struggling. It just kept repeating its standard verification questions.

Bug: Agent Repeatedly Requests and Confirms Previously Collected Patient Information

Description:

After the patient provides information such as their date of birth and confirms its accuracy, the agent continues asking for the same information and repeatedly requests confirmation. Instead of recognizing that the information has already been collected and verified, the agent re-enters the verification flow, resulting in unnecessary repetition and a poor user experience.

One example: scenario_03_20260705_123631

Bug: Agent Initiates Patient Verification for a General Insurance Inquiry

Description:

When the patient asks a general question about whether Blue Cross Blue Shield PPO is accepted, the agent immediately begins collecting and verifying patient information (name, date of birth, and phone number) instead of answering the inquiry. The agent follows the patient verification workflow even though the request is not patient-specific, resulting in unnecessary friction and failing to address the patient's original question.

Where to find: scenario_04_20260705_124805

Bug: Agent Ignores Scheduling Constraint and Continues Patient Verification

Description:

When the patient repeatedly requests a Sunday morning appointment, the agent fails to acknowledge that the clinic is closed on Sundays and instead continues collecting and verifying patient information. Rather than informing the patient that the requested time is

unavailable and offering alternative appointment options, the agent remains in the verification workflow without addressing the scheduling constraint.

Where to find: scenario_07_20260705_130419

Bug: Agent Misrecognizes and Repeats Patient Names Incorrectly

Description:

The agent incorrectly recognizes certain patient names during speech recognition, introducing or omitting sounds (e.g., interpreting "Gary" as "Ngary" or "Gry").

Where to find: scenario_16_20260703_234204

Bug: Agent Loses Conversation Context and Reverts to Initial Identity Verification

Description:

After the conversation progresses, the agent forgets the patient's previously provided and confirmed name and reverts to the initial greeting by asking, "Am I speaking with Maria?" This indicates a loss of conversational context, causing the verification process to restart and trapping the interaction in a repetitive loop.

Bug: Agent Proceeds Without Waiting for Patient Response

Description:

The agent asks the patient whether they would like to reschedule but immediately continues with, "Please hold while I find the earliest available appointment next week," before giving the patient an opportunity to respond. The agent should wait for and process the patient's answer before advancing to the next step in the conversation.
